1 INTRODUCTION

1.1 Qualification title and code

WJEC Level 3 Applied Diploma in Medical Science QAN code: 601/7644/1

1.2 Statement of purpose

Medical Science is the science of dealing with the maintenance of health and the prevention and treatment of diseases. The Level 3 Applied Diploma in Medical Science is for learners who are interested in careers related to healthcare and medical research. Medical scientists are at the forefront of healthcare services, as they are vital in the diagnosis of disease, determining the effectiveness of treatments and searching for new cures.

The Level 3 Applied Diploma in Medical Science is for post 16 learners who have already enjoyed and been successful in science. Typically learners starting this qualification will already have science qualifications at level 2, e.g. GCSEs in science subjects or GCSE Applied Science (Double Award).

The main purpose of the qualification is to provide learners with the knowledge, understanding and skills in key scientific principles to support progress to higher education or employment in areas of Medical science, such as job roles in physiological sciences or clinical laboratory services. The qualification covers the key topic areas of health, physiology and disease, as well as providing the opportunity to study the areas of pharmacology, physiological measurement, clinical testing and medical research. In order to achieve the Level 3 Applied Diploma in Medical Science learners are required to complete 6 units:

- Human health and disease
- Physiological measurement techniques
- Medical Science research methods
- Medicines and treatment of disease
- Clinical laboratory techniques
- Medical case study

Each unit has a clear medical science purpose which focuses the learning of scientific knowledge, understanding and skills into a meaningful context.

This qualification equips learners with scientific knowledge and understanding, as well as practical skills that would support progression to a range of job roles within health care. Job roles such as those within the areas of life sciences, i.e. carrying out a range of laboratory and scientific tests to support the diagnosis and treatment of disease, this could include microscopic examination of tissue samples, analysis of blood cells to investigate anaemia or analysis of samples to identify the cause of an infection. Alternatively there would also be opportunities to progress to job roles within the physiological sciences, working directly with patients, measuring and evaluating particular organ and systems, such as scientists working in neurophysiology recording the electrical activity in the brain.

A significant proportion of career opportunities in this sector are at degree level. When supported by other appropriate qualifications, the Level 3 Applied Diploma in Medical Science will enable progression to higher education to a range of Applied Science programmes, such as biomedical science, life sciences, and physiology.

The Level 3 Applied Diploma in Medical Science is one of two qualifications offered by WJEC in this subject area. The level 3 Applied Diploma is equivalent in size to one A level. WJEC also offers a Certificate in Medical Science which is equivalent to half an A level.

Studying the Level 3 Applied Diploma in Medical Science allows time in the curriculum for other qualifications to be studied alongside it, these would typically be A levels such as Psychology or Chemistry or another Applied General qualification in an area such as Health and Social Care or Environmental Science.

The Level 3 Applied Diploma in Medical Science is intended to be an Applied General qualification.

The Level 3 Applied Diploma in Medical Science is supported by a number of Higher Education Institutions including:

Bangor University
Bristol University of the West of
England Cardiff Metropolitan
University
Swansea University
University of Chester

These universities recognise this qualification for entry to a specified degree programmes. Copies of the letters of support can be found on the qualification page of the WJEC and WJEC Eduqas websites.

2 QUALIFICATION STRUCTURE

WJEC Level 3 Applied Diploma in Medical Science

The units are summarised in the table below.

Unit number	WJEC entry code	Unit title	Mandatory/ optional	Assessment (external/ internal)	GLH
1.	4463U1	Human health & disease	mandatory	external	90
2.	4463U2	Physiological measurement techniques	mandatory	internal	45
3.	4463U3	Medical Science research methods	mandatory	internal	45
4.	4463U4	Medicines and treatment of disease	mandatory	internal	100
5.	4463U5	Clinical laboratory techniques	mandatory	external	45
6.	4463U6	Medical case study	mandatory	external	35

Learners need to complete the **six** units to achieve the WJEC Level 3 Applied Diploma in Medical Science. Unit 6 is synoptic for the qualification. Unit 1 also contains a synoptic component for units 2 and 3.

Cash in Certificate: 4463QC

Cash in Diploma: 4463QD

3 ASSESSMENT

WJEC Level 3 Applied Diploma in Medical Science is assessed using a combination of internal and external assessment.

3.1 Relative weighting of assessment

The relative weighting of the internal and external assessment is shown in the table below.

	Internal			External		
Unit no.	2	3	4	1*	5	6**
%	12.5	12.5	25	25	12.5	12.5

* The unit 1 exam will also be synoptic for units 2 & 3

** The unit 6 exam will also be synoptic for units 1, 2, 3, 4 & 5

3.2 External assessment

In order to appropriately assess skills, knowledge and understanding, the specification uses two types of external assessment:

- written examinations for unit 1 and unit 6 (sections 3.2.1 to 3.2.4)
- an externally set and marked, task based assessment for unit 5 (section 3.2.5).

3.2.1 Unit 1

This examination is synoptic and will include questions based upon content from unit 2 and unit 3 as well as unit 1 of the qualification. Synoptic questions will require the learner to integrate the knowledge, understanding and skills from unit 2 and 3 in the context of human health and disease (unit 1 content). It will consist of one written **two hour (90 marks)** examination available in the summer of each year.

Assessment criteria from each learning outcome from unit 1, and content from unit 2 and unit 3 will be assessed in the examination. Marks will be apportioned as follows:

Unit	Unit 1				Unit 2	Unit 3	
Learning Outcome	LO1	LO2	LO3	LO4			Total
Allowed range	18-23	18-23	18-23	10-15	8-12	8-12	90

Each paper will consist of two sections (Section **A** and **B**). All questions in both sections will be compulsory.

Section A

- Questions will be based upon a pre-release article and connected specification content.
- The pre-release article is intended to provide a medical context for questions in section **A**. It will also contain medical data and information for analysis and/or evaluation.
- Between 22 and 25 marks will be available for Section **A**.

Section B

- Questions set within a medical context. All questions will require the learner to engage with stimulus material. Stimulus material may include images, diagrams, photographs, graphs and information.

3.2.2 Administration of pre-release material (unit 1)

The pre-release article will be available for centres to download from the WJEC website 4 weeks before the exam. Teachers can use the pre-release material in lessons with learners after it has been released on the WJEC website.

Learners will be issued with a clean copy of the pre-release article for the examination. Learners are not permitted to take an annotated copy of the pre-release article into the examination.

3.2.3 Unit 6

This is a synoptic assessment based upon the content of all units in the qualification. The assessment will take the form of a written examination with questions based upon three different case studies. The case studies will provide a medical context for questions in this paper and will change each year. The case studies will require candidates to integrate the knowledge, understanding and skills developed through units 1 to 5. No other learning other than that gained in the specification will be examined although learners are required to be familiar with terms specified in the case study background information sheets.

The examination will consist of one written **90 minute (75 marks)** examination available in the summer of each year. All questions in the paper will be compulsory. All questions will also require the learner to engage with stimulus material. Stimulus material may include images, diagrams, photographs, graphs and information.

Assessment criteria from each learning outcome will be assessed in the examination. Marks will be apportioned as follows:

Learning Outcome	LO1	LO2	LO3	LO4	LO5	Total
Allowed range	20-25	8-12	8-12	20-25	8-12	75

3.2.4 Administration of case studies (unit 6)

Background information relating to the case studies will be available for centres to download from the WJEC website 4 weeks before the exam. The information sheet for each case study will be no more than one A4 page in length. Teachers can use the case studies in lessons with learners after they have been released on the WJEC website.

Candidates need to be familiar with the information in the case studies and the related specification content.

Learners will be issued with a clean copy of the case studies for the examination. They will **not be** permitted to take an annotated copy of the case studies into the examination.

3.2.5 Unit 5

This unit is externally assessed by an assignment which is set and marked by WJEC. The assessment for the unit will be provided annually by WJEC in September of the academic year in which they are to be taken via the WJEC secure website. The assessment must be completed and submitted for marking in the same academic year as it is set. Centres are **not** allowed to modify the provided assignment for unit 5.

The assessment is carried out by the learners under controlled conditions. The controls (time, supervision, resources and collaboration) for task taking are described within the assessment. The general principles for the control of the external assessment of unit 5 are outlined below.

Controls for task taking (external assessment)

There are five areas of task taking that are controlled: time, resources, supervision, collaboration and resubmission.

Time

Each assessment will specify the total amount of time available for summative external assessment.

Resources

The supervisor should ensure suitable resources are provided to all learners to ensure fair and valid assessment takes place. Where specific resource controls must be in place, these will be stated in the assignment.

Supervision

Learners must be supervised whilst completing externally set assessment tasks. Assessments will specify the level of supervision required. Centres must have in place systems to ensure learners cannot access evidence they have been developing outside of supervised activities.

Authentication

Supervision is in place to ensure the authenticity of evidence produced for summative assessment. Supervisors should **not** provide input or guidance to learners during the controlled assessment time. This includes providing formative feedback on the evidence being produced. Supervisors can provide guidance on the requirements of the task and remind learners of the performance bands and how they can be interpreted. Assessors must intervene where there a health and safety issue is observed.

Learners can review and redraft evidence independently within the time controls for the assessment.

Learners must sign a declaration to confirm that all evidence submitted for marking by WJEC is their own work and that any sources used have been acknowledged.

Supervisors must sign a declaration to confirm that evidence submitted for marking by WJEC was completed under the controlled conditions set out in the assignment.

Collaboration

The assessment will indicate whether:

- group work may take place;
- group work is forbidden.

3.2.6 Resitting external assessment

Learners are allowed **two** resits of each external unit. The highest grade will contribute towards the overall grade for the qualification.

3.3 Internal assessment

These units are internally assessed and externally moderated:

Unit 2
Unit 3
Unit 4

For internal assessment please consult 'WJEC's Instructions for conducting controlled assessment'. This document can be accessed through the WJEC website (www.wjec.co.uk). Each centre must ensure that internal assessment is conducted in accordance with these controls.

The following principles apply to the assessment of each internally assessed unit.

- Units are assessed through summative controlled assessment.
- Controls for assessment of each internally assessed unit are provided in a model assignment.

- Each internally assessed unit must be assessed independently. Learners may produce a piece of evidence that contributes to assessment criteria for more than one unit. This is acceptable provided it can be clearly attributed to a specified assessment criterion and has been produced under the appropriate controlled conditions for each unit.
- Performance bands are provided to enable centres to mark the controlled assessment. There are three stages of assessment that will be controlled:
 - task setting;
 - task taking;
 - task marking.

Controls Task setting

For internal assessment, WJEC has produced model assignments for each unit. Centres are, however, allowed to modify the assignment within specified parameters. This will allow centres to tailor the assessment to local needs.

The model assignment has been written to ensure the following controls are in place.

- Each unit is assessed through one assignment.
- Each assignment must have a brief that sets out an applied purpose. An applied purpose is a reason for completing the tasks that would benefit society, a community, organisation or company. Further details are in the rationale in Section 1.2.
- The assignment can specify a number of tasks but tasks must be coherent, i.e. show how the assessment requirements all contribute to the achievement of the applied purpose of the assignment.
- The assignment must provide each learner with the opportunity to address all assessment criteria and all performance band requirements.
- The assignment must indicate the acceptable forms of evidence. These must conform to those forms set out in the model assignment.
- Where a centre has adapted the model assignment, there must be evidence of quality assuring its fitness for purpose. Sample documentation for this activity is provided with each model assignment.

Model assignments are available from the WJEC secure website.

Task taking

There are five areas of task taking that are controlled: time, resources, supervision, collaboration and resubmission.

Time

Each model assignment will specify the total amount of time available for summative assessment. Centres have the discretion for how that time is allocated to each task.

Resources

The assessor can determine which resources should be provided to all learners to ensure fair and valid assessment takes place. Where specific resource controls must be in place, these will be stated in the model assignment.

Supervision

Learners must normally be supervised by an assessor whilst completing controlled assignment tasks. Model assignments will specify if supervision is not required. Centres must have in place systems to ensure learners cannot access evidence they have been developing outside of supervised activities.

Authentication

Supervision is in place to ensure the authenticity of evidence produced for summative assessment. Assessors are not expected to provide input or guidance to learners during the controlled assessment time. This includes providing formative feedback on the evidence being produced. Assessors can provide guidance on the requirements of the task and remind learners of the performance bands and how they can be interpreted. Assessors must intervene where there is a Health and Safety hazard observed.

Learners can review and redraft evidence independently within the time controls for the assessment.

Learners must sign a declaration to confirm that all evidence submitted for moderation is their own work and that any sources used have been acknowledged.

Assessors must sign a declaration to confirm that evidence submitted for moderation was completed under the controlled conditions set out in the model assignments.

Collaboration

The model assignment will indicate whether:

- group work must take place;
- group work is forbidden;
- centres can elect to complete tasks through group work.

Where group work takes place, the following principles must be applied.

- Tasks should allow each member of the group to have full access to all performance bands for all assessment criteria;
- Learners must provide an individual response as part of any task outcome;
- Evidence of individual response may include written evidence (e.g. notes, evaluations, mind maps, etc.) and/or audio-visual evidence (e.g. recordings, photographs, drawings, designs, etc.);
- Evidence must be clearly attributable to each individual member of the group;
- Individual contributions must be clearly identified and stated on the accompanying authentication sheet which must be signed by both the teacher and the candidate;
- Assessment of the individual must be based on the individual contribution to the evidence produced;
- Learners achievement must not be affected by the poor performance of other group members;
- Learners' achievement must not benefit from the performance of other group members.

Resubmission

Learners may resubmit internally assessed units. The learner must submit a new assessment, completed within the same levels of control. They cannot improve previously submitted work.

Learners have one resit opportunity for each internally assessed unit.

Where an individual learner who has previously submitted group work for assessment wishes to resit an internally assessed unit, one of the following options **must** be taken:

- the candidate must create a new piece of work within the same group;
- the candidate must create a new piece of work within a new group;
- the candidate must create a new piece of work with non-assessed candidates;
- the candidate must create an individual piece of work.

The same levels of control for group work, as outlined above, will apply to candidates who choose to re-sit.

Task marking

All marking of evidence must be made against the assessment criteria and performance band statements given in each unit specification. Evidence marked must comply with the controlled requirements set out in the model assignment.

Written evidence must be annotated to show how it relates to the assessment criteria and performance band requirements.

Performance evidence, for example of giving a presentation, must be made on observation records. Observation records will include a description of learner performance as well as a summative statement on the quality of that performance. Where performance is observed by someone other than an assessor, the 'witness' must complete a witness statement.

Assessors will need to authenticate the statement either through scrutiny of supporting evidence and/or questioning of the learner and/or witness. If the statement is authenticated, it can be allowed to contribute to the evidence for assessment. Evidence of authentication will also need to be included. Each model assignment that allows performance evidence will include a sample observation record and witness statement.

Marking should only be undertaken by a designated assessor. An assessor should have appropriate expertise in the subject and level for a specified unit. The assessor is responsible for ensuring that:

- Assessment is conducted under specified controlled conditions;
- They are clear about the requirements of the learning outcomes, assessment criteria and performance band statements prior to commencing controlled assessment;
- Evidence presented for assessment is authentic;
- Assessment decisions are accurately recorded;
- Evidence is appropriately annotated;
- Observation records contain sufficient detail for objective corroboration of decisions;
- Judgements are only made against the performance band statements.

3.4 Synoptic assessment

Synoptic assessment 'requires a candidate to identify and use effectively in an integrated way an appropriate selection of skills, techniques, concepts, theories, and knowledge from across the course content.'

'Level 3 Vocational Qualifications for 16-19 year olds. Technical Guidance for Awarding Organisations' DfE p14

Unit 6

Unit 6, in the WJEC Level 3 Applied Diploma in Medical Science, is an externally assessed synoptic unit that examines learners understanding of key underpinning scientific principles used in the qualification. It has been designed to enable learners to identify and use skills, techniques, concepts, theories, and knowledge from across the specification content. The unit assessment is based around three case studies. Background information to the three case studies is released just before the examination (details of the management of the case study background information sheets can be found in **Section 3.2.4**). No other learning other than that gained in the specification will be examined although learners are required to be familiar with terms specified in the case study background information sheets.

This assessment (externally set examination) requires learners to apply the knowledge, understanding and skills they have acquired to questions based upon three case studies. These questions are designed to draw together the learning from the entire specification.

This questions based around the case studies are intended to allow learners to:

- show links and holistic understanding between all units in the specification
- demonstrate the interrelationship between overarching concepts and issues
- draw together and integrate knowledge, understanding and skills
- apply scientific knowledge and approaches to different medical contexts
- put forward explanations to support statements they have made
- apply knowledge, understanding and a range of scientific skills from across different units to different medical contexts
- transfer skills learnt in one context to a different context
- evaluate and justify decisions, choices and recommendations.

Each examination will test knowledge, understanding and skills from across the qualification.

Section 3 describes the weighting each unit makes to the questions in the external assessment.

Although unit 6 does not introduce new content, learners will need time to synthesise and integrate their learning in order to demonstrate synoptic learning.

Unit 1

Unit 1, in the WJEC Level 3 Applied Diploma in Medical Science, is also an external unit with a synoptic component that requires learners to integrate their knowledge, understanding and skills from units 2 and 3 in the context of human health and disease (context of learning in unit 1). The assessment will require the learner to show holistic understanding between the content of unit 1, unit 2 and unit 3, and requires learners to transfer knowledge, understanding and skills learnt in one context to another.

3.5 Standardisation

Centres are expected to standardise internal assessment decisions. This is the process by which centres ensure that all learners are judged to the same standard across different assessors, teaching groups and from year to year. Evidence of standardisation should be submitted with learner evidence.

Where more than one assessor is involved, the centre must appoint a Lead Assessor. The role of the Lead Assessor is to:

- Document all activities;
- Ensure that the assignment presented to learners is fit for purpose and complies with all controls;
- Ensure all assessors have appropriate documentation in place to support fair and valid assessment decisions;
- Ensure all assessment activities are in accordance with the task taking controls for the unit;
- Sample assessment judgements at appropriate times to ensure the performance bands are correctly and consistently applied;
- Provide feedback to assessors;
- Provide support to assessors on interpretation of performance band requirements.

4 GRADING

This is a unitised specification which allows for an element of staged assessment. Learners can only resit an internally assessed unit once but may resit an externally assessed unit twice (with the better result counting) before aggregation for the qualification award. Results for a unit have a shelf-life limited only by the shelf-life of the specification.

Unit grades will be awarded to give a general indication of the standards of achievement shown by learners. Unit grades will be awarded as shown in the table below. The descriptions must be interpreted in relation to the content specified by the unit; they are not designed to define that content. The grade awarded will depend in practice upon the extent to which the candidate has met these overall. Shortcomings in some aspects of the assessment may be balanced by better performances in others. Learners who fail to achieve an E grade in a particular unit will be awarded a U (unclassified grade) for that unit.

A 'near pass' rule has been introduced for all **external units**. A candidate will achieve a pass (or higher) grade for the qualification if they meet the following two requirements:

- i) Achieve the total UMS required at the relevant grade for the qualification
- ii) Obtained at least the minimum UMS for the relevant external units

Individual unit results are reported on a uniform mark scale (UMS). The grade equivalences for the Level 3 Applied Diploma in Medical Science are given in the following tables.

Unit	Assessment type	Raw Mark	weighting %	UMS mark	UMS grade boundaries					
					A	B	C	D	E	N
1	External	90	25	240	192	168	144	120	96	72
2	Internal	80	12.5	120	96	84	72	60	48	
3	Internal	92	12.5	120	96	84	72	60	48	
4	Internal	100	25	240	192	168	144	120	96	
5	External	80	12.5	120	96	84	72	60	48	36
6	External	75	12.5	120	96	84	72	60	48	36

The Level 3 Applied Diploma in Medical Science qualification is reported on a six point scale: E, D, C, B, A & A*. The attainment of learners who do not reach the minimum standard for an E grade will receive a U (unclassified) grade and will not receive a qualification certificate.

Candidates may resit internally assessed units **once only, and externally assessed units twice**. The best grade will be used for aggregation. If a candidate wishes to resit an internal unit more than once or an external unit more than twice, no results from units taken previously may be used in aggregating the new grade and all units in the qualification must be taken again.

To achieve an A, B, C, D or E grade, learners must obtain:

- the minimum UMS mark for the qualification grade (see **Table: UMS and qualification grade**);
- and**
- a pass in **all units**.

To achieve an A* grade, learners must obtain:

- the minimum UMS mark for the qualification grade (see **Table: UMS and qualification grade**);
 - a minimum of an E grade in **all units**.
- and**
- 90% of the UMS marks available on units 4, 5, and 6.

Table: UMS and qualification grade

Grade	A*	A	B	C	D	E	Max. Mark
Mark	864	768	672	576	480	384	960

Units 1 to 3 are common to the WJEC Certificate in Medical Science.

5 UNITS

Unit 1 Human health and disease

WJEC unit entry code

Guided learning hours 90

Aim and purpose

This unit develops knowledge and understanding of human anatomy and physiology. The unit will develop an understanding of the function of organ systems and some problems that can occur in these systems.

The unit will enable learners to understand the normal functioning of the body at a cellular and physiological system level. They will learn how these systems react in different situations, and how these systems can go wrong in order to report on health of individuals.

Unit introduction

What systems are fundamental to maintenance of human life? How do these systems work normally? How do systems influence each other? How do these systems compensate when our activities change? Why do these systems sometimes go wrong?

Healthcare professionals and scientists working in the healthcare sector need to understand the anatomy and physiology of the human body. An understanding of how physiological systems work under normal circumstances is fundamental to maintain good health. This understanding is also crucial to enable treatment of individuals when injury or disease occurs. There are a huge number of healthcare professionals that deliver care and treatment to a diverse range of patients. Scientists also work in the healthcare sector, as well as in universities, government agencies and in the pharmaceutical and bioscience industries.

Some of the features and characteristics of healthcare professionals and medical scientists such as meeting deadlines, attention to detail, methodical approach and analytical thinking are important transferable skills, applicable in all aspects of life and work. They must have good communication skills as liaison with patients, other scientists and healthcare workers, and other agencies is often necessary.

This unit is designed to help you understand the ways that healthcare professionals and scientists involved within the medical sector work so that you will be able to tackle problems and answer questions in a medical context. This will involve you examining the key principles that underlie the functioning of our body systems, how they are maintained and how problems can arise.

Assessment

This unit is assessed through a written examination set each summer. Details relating to the external assessment and the management of the pre-release article accompanying the examination can be found in **section 3.2.1** and **3.2.2** of the specification.

Guidance for Delivery

Making teaching vocationally relevant

It is important that learners recognise the knowledge and understanding they develop are vocationally relevant. There are a number of ways in which this can be achieved:

- arranging visits to work places, e.g. clinical laboratories or healthcare establishments.
- arranging talks by visiting speakers, e.g. healthcare professionals, clinical scientists or scientists working in the pharmaceutical industry.
- using data from websites such as Public Health Wales/England to look at causes and spread of disease.
- Developing learning activities in conjunction with universities or healthcare professionals.

This unit is closely related to the content and context of units 2 and 3. The content is therefore best integrated into the delivery of units 2 and 3.

Unit 2 Physiological measurement techniques

WJEC unit entry code

Guided learning hours 45

Aim and purpose

This unit develops knowledge and understanding about the physiological measurements that can be made to assess the function of major body systems. It relates anatomy and physiology to physiological measurement test results, through an understanding of the principles of the measurement techniques.

The unit will enable learners to perform tests which will accurately measure a range of physiological functions. They will be able to interpret the results of these tests and other tests and link this to possible physiological disorders.

Unit introduction:

Physiological measurements play a very important role in the diagnosis and treatment of patients in a range of clinical settings. What simple clinical measurements can be carried out? How are complex measurements carried out? How do we know what measurement to select?

When physiological measurements are carried out - such as measuring temperature, pulse rate or respiration rate – healthcare professionals are monitoring for signs of abnormality (i.e. anything that falls outside of the 'normal' range). Health professionals will then be able to draw conclusions about the health status of the individual and evaluate any treatments they may require. Most healthcare scientists involved with physiological measurement work in hospital clinics and departments or as part of surgical teams.

This unit is designed to help you understand how healthcare scientists who work in physiological sciences, investigate the function of body systems by undertaking physiological measurements. This involves using specialist equipment, advanced technologies and a range of different procedures.

		Band 1	Band 2	Band 3
LO2 understand how to deal with patients	AC2.1 explain importance of patient confidentiality	Gives an explanation of the importance of patient confidentiality <i>Low level explanations may not always clearly show reasoning</i> 1-2	Gives a mainly accurate and coherent explanation of the importance of patient confidentiality 3-4	Gives an accurate and coherent explanation of the importance of patient confidentiality 5-6
	AC2.2 describe conduct towards patients	Gives a description of some conduct towards patients 1-2	Gives a mainly clear description of conduct towards patients <i>Some parts may be in detail</i> 3-4	Gives a clear and detailed description of conduct towards patients 5-6
LO3 be able to carry out physiological measurement tests	AC3.1 plan to perform physiological measurement tests	Gives some key aspects of performing physiological measurement tests in the plan 1-2	Gives a mainly detailed and suitable plan to perform physiological measurement tests <i>Some parts may be in detail</i> 3-4	Gives a detailed and suitable plan that covers all key aspects of how to perform physiological measurement tests. <i>The plan is logically structured and can be easily understood</i> 5-6
	AC3.2 use physiological testing equipment	Correctly uses some physiological testing equipment 1-2	Correctly uses a range of physiological testing equipment 3-4	
	AC3.3 record results from physiological measurement tests	Most key data is recorded Entries are generally legible Some data recorded to appropriate precision 1	All key data is recorded Most entries are legible Most data recorded to appropriate precision and with suitable units 2-3	All key data is recorded All entries are legible All data recorded to appropriate precision and with suitable units 4

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO4 be able to report on physiological testing	AC4.1 process data from physiological measurement tests	Processes data from physiological measurement tests using appropriate techniques. Some aspects of graphs/calculations are clearly and logically presented Makes a limited use of significant figures. 1-2	Accurately processes data from physiological measurement tests using appropriate techniques. Graphs/calculations are mostly clearly and logically presented Makes some appropriate and accurate use of significant figures. 3-4	Consistently, systematically and accurately processes data from physiological measurement tests using appropriate techniques. Graphs/calculations are clearly and logically presented Consistently makes appropriate and accurate use of significant figures. 5-6
	AC4.2 make evidence based conclusion about the “health” of individuals	Makes some simple and mostly appropriate conclusions based upon evidence Some conclusions are linked to the evidence 1-2	Makes valid conclusions based upon evidence (with some detail) The conclusions are clearly linked to the evidence 3-4	Makes valid and detailed conclusions based upon evidence The conclusions are clearly and logically linked to the evidence 5-6
	AC4.3 evaluate information from physiological measurement tests	Makes some valid judgements about information from physiological measurement tests with some reasoning 1-2	Makes mainly valid judgements about information from physiological measurement tests, showing clear reasoning 3-4	Makes valid judgements about information from physiological measurement tests, showing clear reasoning 5-6
	AC4.4 communicate in writing	Communicates some information from physiological measurement tests Uses some scientific and technical language appropriate to the audience. Uses some appropriate styles and structure Uses some accurate spelling, punctuation and grammar 1-2	Mostly clearly communicates information from physiological measurement tests Mostly uses scientific and technical language appropriate to the audience. Uses mostly appropriate styles and structure Uses mostly accurate spelling, punctuation and grammar 3-4	Clearly communicates information from physiological measurement tests Consistently uses scientific and technical language appropriate to the audience. Uses appropriate styles and structure Uses accurate spelling, punctuation and grammar 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Assessment

This unit is internally assessed and externally moderated through a summative controlled assessment. All assessment must be conducted under controlled assessment conditions.

Section 3.3 of the specification details the principles involved in internal assessment.

WJEC has produced a model assignment for this unit which is available through the WJEC secure website.

The unit 1 examination will also contain a synoptic component that includes content from unit

Details of the examination and the contribution of unit 2 to the assessment can be found in section **3.2.1**.

Guidance for Delivery

Making teaching vocationally relevant

It is important that learners recognise the knowledge and understanding they develop are vocationally relevant. There are a number of ways in which this can be achieved:

- Arranging visits to work places with physiological measurement testing equipment, this could include; hospitals departments, opticians, GP surgeries and Health centres;
- Providing work experience with organisations that perform physiological measurement tests to assess health. This could be in a hospital or health care setting, but could also include health and leisure centres or private gyms. This work experience could be just a one or two day experience or could form part of a planned school work placement scheme;
- Arranging talks by visiting speakers from a range of Health Care professions: clinicians, technicians, doctors and nurses;
- Developing learning activities in conjunction with individuals/organisations that perform physiological measurement tests or use the results of tests;
- Using real life data from physiological measurement tests. For example local hospitals or gyms may be able to provide anonymised data from the last 20 individuals that undertook lung function tests, or they may be able to provide ECG traces.

The following are examples of approaches to delivery which could be used to enhance the learners' understanding of the vocational importance of physiological techniques.

Example 1

Learners will need to be provided with formative opportunities to undertake the physiological measurements required as part of the summative assessment for this unit before they undertake the controlled assessment. A local sports team, such as a local amateur football or rugby team could be contacted to act as "subjects" for the tests, in a "Who is the healthiest member of the team competition". Work stations could be set up to test "Who in the team has the greatest lung capacity?" "Who has the lowest blood pressure?" "Who has the slowest recovery rate?" Groups of learners would run each work station and collect all results. These results could then be pooled into a class set of results, which could be presented to the team to award "the healthiest member of the team".

Example 2

Learners could be provided with a range of actual patient results from hospital departments—ECG traces, 24 hour blood pressure measurements, peak flow measurements, EEG results, and audiology measurements. Learners could then work in teams to discuss results, interpret these against accepted health ranges, considering normal and abnormal results. Each group could then present their findings to other groups.

Example 3

Learners could take on the role of a sales team for a physiological measurement equipment company. Each “sales team” could take on the responsibility for specific areas of equipment—one team for example specialises in cardiovascular equipment, another specialises in equipment for audiology etc. A local private hospital is thinking about investing in physiological measurement equipment across 5 clinical areas: cardiovascular, respiratory, audiology, neurophysiology and gastrointestinal physiology. Each sales team must give a presentation about the equipment their company could supply, this equipment must include the principles of how the equipment works and what its main purpose would be.

Making Contacts

Examples of organisations that may be approached to provide help include:

- hospitals and Health Care Trusts;
- other health care settings and individuals (e.g. doctors, practice nurse, health centres);
- opticians;
- private health care facilities;
- council run leisure facilities;
- private gyms and leisure facilities;
- university medical and human biology departments.

Resources

Textbooks

Any general physiology text books aimed at level 3 learners will support understanding for this unit, text books aimed at Physical Education students and Human Biology students would support underlying principles. There are also some specific texts available, but it should be noted that these may go beyond the expected level of understanding for this unit.

- The Physiological Measurement Handbook: John G. Webster: CRC Press: Dec 2014 (ISBN-13: 978-1439808474).
- Marriot's Practical Electrocardiology (12th Edition): Galen S. Wagner: 2014.

The National STEM centre e-library has a range of resources which would support the delivery of this unit, for example:

<http://www.nationalstemcentre.org.uk/elibrary/resource/7519/electrocardiograms>

This resource from the Institute of Physics, describes how electrocardiograms (ECGs) record the activity of the heart through electrodes placed on a patient's skin. The teacher's notes contain an introduction to ECGs and lesson notes for the associated PowerPoint file. A mark scheme for the worksheet is also included. The worksheet contains questions that could be used as a summative test on the topic (10 marks). The animated PowerPoint shows how blood flow and muscle contraction within the heart is related to the ECG trace. The graphs show how heart rate can be calculated by measuring the period between successive peaks on the ECG.

<http://www.nationalstemcentre.org.uk/elibrary/resource/2689/blood-pressure>

This is an article about fainting in the "Catalyst" magazine. Although aimed initially at GCSE students, this would be a useful article for self directed study and subsequent class discussion.

http://www.nationalstemcentre.org.uk/dl/30dbf2418345a221623158fc61f6ed409c6308dc/866_4-catalyst_17_3_311.pdf

This article again from the Catalyst magazine, discusses the basic functioning of the eye as well as physiological measurements that are undertaken to diagnosis eye problems.

Unit 3 Medical Science research methods

WJEC unit entry code

Guided learning hours 45

Aim and purpose

This unit develops knowledge and understanding of planning, conducting and reporting of research in medical sciences using a range of methodologies and techniques. It is intended to enable the acquisition of the necessary knowledge and skills to carry out research in order to obtain meaningful information. It also seeks to promote an understanding of the processes involved in drawing meaningful inferences from research data.

Learners will use their knowledge and understanding of research methods to conduct their own research. They will process the data they have collected and make evidence based conclusions.

Unit introduction

How can we find out if lifestyle affects health? How has medical science research been carried out to show that MMR is not connected to autism? Is there a meaningful connection between alcohol consumption and life expectancy? How could research be carried out to find if eating 'five-a-day' of fruit and vegetables is linked to good health? How can we improve the way in which ulcers are managed in hospital? Are sedentary children more likely to get ME? Why do people start smoking?

Medical research methods are intended to help answer questions like the ones outlined above. Real-life studies can be complex because of the many variables that need to be taken into account and controlled. This unit is designed to help you think through the issues involved in research so that we can have confidence in the conclusions that have been made.

In this unit, you will be introduced to the methods of scientific enquiry which are used to answer questions such as those proposed above. The unit has been designed to develop your knowledge and understanding of planning, conducting, analysing and reporting research in medical sciences. It will do this by introducing you to a range of methodologies and techniques that are used. It will also encourage the acquisition of a range of evaluative concepts for reviewing and discussing the design and outcome of research. All of this will be done through a hands-on approach where you will plan and collect information to answer questions connected to medical science.

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome	Assessment criteria	Performance bands		
<i>The learner will:</i>	<i>The learner can:</i>	Band 1	Band 2	Band 3
LO2 be able to collect data	AC2.1 plan to collect data	Produces a plan with a sequence of steps with some indication of timing 1-2	Produces a plan with a mainly logical sequence of steps and mainly achievable time scales <i>Some parts may be in detail</i> 3-4	Produces a detailed plan with a logical sequence of steps and achievable time scales that can be followed by a third party 5-6
	AC2.2 produce documentation to collect data	Produces documents that will capture some suitable/relevant data 1-2	Produces documents that will capture mainly suitable and relevant data 3-4	Produces clear documents that will capture sufficient, suitable and relevant data 5-6
	AC2.3 obtain data	Obtains some suitable data 1	Obtains mainly suitable and sufficient data 2-3	Obtains suitable and sufficient data 4
LO3 understand data analysis	AC3.1 explain significance of terms used in data analysis	Gives an accurate and coherent explanation showing detailed reasoning of the significance of some terms used in data analysis 1-2	Gives a mainly accurate and coherent explanation showing detailed reasoning of the significance of some terms used in data analysis <i>Some parts are detailed</i> 3-4	Gives an accurate and coherent explanation showing detailed reasoning of the significance of terms used in data analysis 5-6
	AC3.2 explain selection of statistical methods used to analyse data	Gives an explanation for the selection of statistical methods used to analyse data 1-2	Gives a mainly accurate and coherent explanation for the selection of statistical methods used to analyse data <i>Some parts are detailed</i> 3-4	Gives an accurate and coherent explanation showing detailed reasoning for the selection of statistical methods used to analyse data 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome	Assessment criteria	Performance bands		
<i>The learner will:</i>	<i>The learner can:</i>	Band 1	Band 2	Band 3
LO4 be able to process data	AC4.1 analyse data using statistical methods	Correctly uses some appropriate statistical methods to analyse data 1-2	Correctly uses suitable and appropriate statistical methods to analyse data <i>Some parts are in detail</i> 3-4	Consistently uses suitable and appropriate statistical methods correctly to make a detailed analysis of data 5-6
	AC4.2 make conclusions from data	Makes some valid conclusions from data Some conclusions are linked to the evidence 1-2	Makes mainly appropriate conclusions from data The conclusions are clearly linked to the evidence 3-4	Makes detailed and appropriate conclusions from data The conclusions are clearly and logically linked to the evidence 5-6
	AC4.3 evaluate procedures	Gives an appropriate evaluation of some aspects of the data and procedures <i>Evaluation may be weighed towards data or procedures</i> 1-2	Gives a mostly clear and accurate evaluation of a range of aspects of the data and procedures 3-4	Gives a clear, detailed and accurate evaluation of a range of aspects of the data and procedures 5-6
	AC4.4 use mathematical notation	Uses some mathematical notation correctly and appropriately Makes some correct use of significant figures 1-2	Uses mathematical notation in a mostly correct and appropriate way Makes a mostly correct use of significant figures 3-4	Consistently uses mathematical notation correctly and appropriately Consistently makes a correct use of significant figures 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome	Assessment criteria	Performance bands		
<i>The learner will:</i>	<i>The learner can:</i>	Band 1	Band 2	Band 3
LO5 be able to communicate information	AC5.1 present data visually	Uses some suitable table/graph styles Uses some suitable sizes and scales to construct graphs Labels some graphs correctly 1-2	Uses mostly suitable table/graph styles Mostly uses suitable sizes and scales to construct graphs Mostly correctly and fully labels graphs 3-4	Consistently uses suitable table/graph styles Consistently uses suitable sizes and scales to construct graphs Consistently correctly and fully labels graphs 5-6
	AC5.2 communicate outcome of research	Communicates some relevant information to the customer Uses some appropriate scientific and technical language Use some appropriate styles and structure Uses some accurate spelling, punctuation and grammar 1-2	Mostly clearly communicates relevant information to the customer Mostly uses appropriate scientific and technical language Uses mostly appropriate styles and structure Uses mostly accurate spelling, punctuation and grammar 3-4	Clearly communicates relevant information to the customer Consistently uses appropriate scientific and technical language Uses appropriate style and structure Uses accurate spelling, punctuation and grammar 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Assessment

This unit is internally assessed and externally moderated through a summative controlled assessment. All assessment must be conducted under controlled assessment conditions. **Section 3.3** of the specification details the principles involved in internal assessment. WJEC has produced a model assignment for this unit which is available through the WJEC secure website.

The unit 1 examination will also contain a synoptic component that includes content from unit 3. Details of the examination and the contribution of unit 3 to the assessment can be found in section **3.2.1**.

Guidance for Delivery

Making teaching vocationally relevant

It is important that learners recognise the knowledge and understanding they develop are vocationally relevant. There are a number of ways in which this can be achieved:

- arranging visits to a university Medical Science / Medical School / Nursing department with particular reference to how they use research to improve medical care. This could be broadened to link with concepts taught in other medical science units;
- arranging talks by visiting speakers from Health agencies / pressure groups e.g. ASH to speak on how medical research has changed attitudes to smoking over the last 60 years.

The following are examples of approaches to delivery which could be used to enhance the learners' understanding of the vocational importance of the role of research methods in Medical Science:

Example 1

Invite a speaker from a pressure group such as ASH to discuss with learners the trends in young people who take up smoking and also attitudes of young people in general to smoking. Learners could be set a task to find attitudes to smoking / reasons why smoking is taken up in their school. The learners could then present their findings to the representative from the pressure group / ASH.

Example 2

A representative from a local Medical School/ hospital/GP practice could be invited to speak to learners on the MMR vaccine and the alleged (erroneous) links with autism and how this could lead to a low uptake of vaccines for measles and consequently outbreaks of measles in several parts of the UK. Learners could be asked to conduct quantitative and qualitative research on current perceptions of autism in the locality. The learners could then in small groups present their findings.

Example 3

Invite a dietician to speak about what makes a healthy diet and the problems associated with a poor diet. Learners could then be asked to conduct qualitative/quantitative research on attitudes to a healthy diet. Data from the research could then be pooled among all the learners and appropriate techniques used to analyse the data. Their findings and significance of their research could then be communicated to the school through an article in the school magazine.

Making Contacts

Examples of organisations that may be approached to provide help include:

- Medical Science/Medicine departments/Nursing Schools at local Universities;
- Hospitals, GP practices;
- Health campaign groups e.g. ASH.

Unit 4 Medicines and treatment of disease

WJEC unit entry code

Guided learning hours: 100

Aim and purpose

This unit develops knowledge and understanding about the science of medicines, and how they work through their interactions with body systems. It also introduces cancer, its relationship to genetics, and the range of therapeutic treatments available.

The unit will enable learners to provide information to a range of audiences on how medicines work, to bring about effective treatment of diseases and disorders.

Unit introduction

Medicines are the most common therapeutic intervention in healthcare. How are medicines used to treat diseases? How do medicines work? What are the possible side effects? Do medicines have the same effect on all patients? Can medicines lose their effectiveness?

What needs to be considered when medicines are prescribed? What is cancer and how is it treated? What role do genes and mutation play in cancer? These are some of the questions that this unit is intended to answer.

The pharmaceutical industry is the UK's top research sector. One-quarter of the world's top medicines were developed in the UK. The pharmaceutical industry spends around £8.8 billion on UK research and development, and employs around 26,000 people. A further 250,000 people work in related industries. The past twenty years has seen an unprecedented increase in both the number and in the range of activity of drugs used in the treatment of human disease. For medicines and treatments to be most effective, those responsible for prescribing and administering them, as well as patients themselves, need advice and information. This unit focuses on providing information and advice on medicines and treatment.

In this unit you will consider the basic science of pharmacology, i.e. the study of medicine action combined with an added focus on the application to the real world - i.e. what medicines are used in the treatment of what disorders and diseases. You will also learn about cancer, what it is and the combination of therapeutic interventions that may be used; which include medicines but may also include new and developing therapies as more is understood about the disease.

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO1 understand management of medicine	AC1.1 explain factors to be considered when prescribing medicines	Factors <ul style="list-style-type: none"> • establishing an accurate diagnosis • patient history (other medicines that are already been taken) • overall benefit • side effects/risks • individual patient factors altering benefits/risks (e.g. age, impaired kidney function, pregnancy) • cost-effectiveness • patient choice
	AC1.2 suggest strategies to improve adherence of patients taking prescriptions	Reasons for non-adherence <ul style="list-style-type: none"> • unintentional • intentional Unintentional <ul style="list-style-type: none"> • barriers outside patient control e.g. difficulty understanding instructions Intentional <ul style="list-style-type: none"> • patient perception e.g. beliefs about drug effectiveness, side effects, media claims • patient motivation Improving adherence <ul style="list-style-type: none"> • e.g. patient education, consultation, involving patients in decision making, support
	AC1.3 compare options for administering medicines	Administration routes <ul style="list-style-type: none"> • oral, sublingual, rectal, topical e.g. eye drops, inhalation bronchodilators, parenteral e.g. intravenous, intramuscular, subcutaneous injection Administration <ul style="list-style-type: none"> • self-administration, health care specialist Comparison <ul style="list-style-type: none"> • patient preference, comfort • ease of administration • speed of action, duration of action • predictability of absorption, reproducible effects, side effects • need to bypass hepatic metabolism • target of action (e.g. local eye drops in treatment of glaucoma, paracetamol in pain relief) • cost

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO2 understand how medicines work	AC2.1 explain the molecular basis of the action of medicines	<p>Drug-receptor interactions</p> <ul style="list-style-type: none"> • agonists: full and partial • antagonists: competitive or irreversible • specificity: ability to combine with one particular receptor <p>Possible ways in which medicines work</p> <ul style="list-style-type: none"> • action on transmitter substances • action on hormones • action on membrane transport systems • action on enzymes
	AC2.2 explain how medicines affect body systems	<p>Body systems</p> <ul style="list-style-type: none"> • cardiovascular & respiratory; gastro-intestinal tract; endocrine system; kidneys and central nervous system <p>Cardiovascular & respiratory</p> <ul style="list-style-type: none"> • treatment of hypertension, angina, arrhythmias, asthma • e.g. beta-blockers, vasodilator drugs, centrally acting drugs, drugs acting at cholinergic synapses, drugs acting on sympathetic nervous system, calcium antagonists, opening/blocking ion channels <p>Gastro-intestinal tract</p> <ul style="list-style-type: none"> • treatment of indigestion, ulcers, constipation, diarrhoea, antacids and acid secretion reducers, medicines affecting motility and secretions • e.g. antacids: sodium bicarbonate, acid secretion reducers (cimetidine), mucosal strengthens (sucralfate), anti-diarrhoeal drugs <p>Endocrine system</p> <ul style="list-style-type: none"> • treatment of overactive/ underactive thyroid, diabetes • e.g. competitive inhibitors, replacement therapy, antidiabetic agents <p>Kidneys</p> <ul style="list-style-type: none"> • treatment of oedema, in a range of disorders and diseases, e.g. congestive heart failure and hypertension • action on the kidney to increase urine flow; diuretics - thiazides, loop diuretics, potassium sparing <p>Central nervous system</p> <ul style="list-style-type: none"> • treatment of depression, insomnia, psychotic states e.g. schizophrenia, motor disorders, Parkinson's disease and epilepsy • control of pain and general anaesthetics • mechanisms of action through modifying synaptic transmission of central transmitter substances such as GABA, acetylcholine, dopamine, and serotonin

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO2 cont.	AC2.3 explain how medicines affect causative agents of infectious diseases	<p>Causative agents</p> <ul style="list-style-type: none"> • bacterial infections • viral infections <p>Mechanisms</p> <ul style="list-style-type: none"> • bacterial infections (medicines that inhibit nucleic acid synthesis: e.g. sulphonamides; medicines that inhibit cell wall synthesis, e.g. penicillins; medicines that inhibit protein synthesis, e.g. chloramphenicol and erythromycin) • viral infections (medicines that stop a virus entering host cells, e.g. amantadine; medicines that inhibit nucleic acid synthesis, e.g. acyclovir)
	AC2.4 explain why medicines may lose their effectiveness	<p>Loss of effectiveness</p> <ul style="list-style-type: none"> • “loss” of receptors for drug-receptor interaction • drug “side effects” • antibiotic resistance
	AC2.5 compare the effects of the interaction of medicines	<p>Interaction of medicines</p> <ul style="list-style-type: none"> • polypharmacy (concurrent use of multiple medications by one individual) • interactions between more than one medication or drug-food interactions <p>Positive effects</p> <ul style="list-style-type: none"> • improves the effects of medicines (synergistic effect) e.g. use of codeine with paracetamol, combinations of drugs in the treatment of cancer • produces a new effect <p>Negative effects</p> <ul style="list-style-type: none"> • antagonistic effect, side effects, overdose

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO2 cont.	AC2.6 explain how factors affect the distribution of medicines in the body	<p>Distribution of medicine in body</p> <ul style="list-style-type: none"> • movement of medicines to and from the blood and various tissues of the body • relative proportion of medicines in the tissues <p>Factors affecting distribution</p> <ul style="list-style-type: none"> • water-soluble drugs • fat-soluble drugs • ability to cross membranes • binding to proteins • accumulation in particular tissue types
	AC2.7 explain how adverse reactions to medicines can occur	<p>Adverse reactions</p> <ul style="list-style-type: none"> • extension of the medicines intended action • action of medicine on more than one receptor/transmitter • production of toxic metabolites e.g. paracetamol • immunological responses
	AC2.8 explain fate of medicines in the body	<p>Fate</p> <ul style="list-style-type: none"> • metabolism: by liver, types of reaction • elimination and excretion: renal excretion, biliary excretion • importance of half-life

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO3 understand principles of treatment of cancer	AC3.1 describe what is meant by the term cancer	Cancer <ul style="list-style-type: none"> • abnormal cell division <ul style="list-style-type: none"> ○ alteration of cell cycle ○ uncontrolled proliferation of cells • primary, secondary • difference between cancer cells and normal cells • types of cancer: carcinoma, sarcoma, leukaemia, lymphoma and melanoma
	AC3.2 explain the genetic basis of cancer	Genetic basis <ul style="list-style-type: none"> • genes are short pieces of DNA that carry specific genetic information • gene mutations (inherited, environmental) • risk factors for mutation Genetics and cancer <ul style="list-style-type: none"> • genetic changes (proto-oncogenes, tumour-suppressor genes and DNA-repair genes)
	AC3.3 describe possible treatment options for cancer	Treatment options <ul style="list-style-type: none"> • surgery • chemotherapy (cytotoxic drugs) • radiation therapy • combination therapy • blood transfusion
	AC3.4 assess the potential impact of new treatments for cancer	New treatments <ul style="list-style-type: none"> • targeted therapy • immunotherapy • photodynamic therapy Impact <ul style="list-style-type: none"> • potential benefits (e.g. improved life expectancy)

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO4 be able to provide information about medicines	AC4.1 communicate information to an audience	<p>Communication method</p> <ul style="list-style-type: none"> • written information e.g. leaflet, website, media article • face-to-face • other e.g. radio, podcast • formal, informal • technical, non-technical <p>Communication</p> <ul style="list-style-type: none"> • clarity • style • level (accessibility, level of language for target audience) • structure <p>Audience</p> <ul style="list-style-type: none"> • patients • medical staff
	AC4.2 justify approach to communicate information	<p>Justification</p> <ul style="list-style-type: none"> • audience addressed • issue(s) addressed • suitability of approach
	AC4.3 work as part of a team	<p>Part of a team</p> <ul style="list-style-type: none"> • flexible • reliable • takes responsibility • relationships <ul style="list-style-type: none"> ○ contributes to team ○ listens to view points ○ treats others in a respectful and supportive manner ○ makes constructive contributions

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO1 understand management of medicine	AC1.1 explain factors to be considered when prescribing medicines	Gives an explanation of the factors to be considered when prescribing medicines <i>Low level explanations may not always clearly show reasoning</i> 1-2	Gives a mainly accurate and coherent explanation showing some detailed reasoning of the factors to be considered when prescribing medicines 3-4	Gives an accurate and coherent explanation showing detailed reasoning of the factors to be considered when prescribing medicines 5-6
	AC1.2 suggest strategies to improve adherence of patients taking prescriptions	Gives some strategies to improve adherence of patients taking prescriptions <i>Strategies show some awareness of the main reasons for non-adherence</i> 1-2	Gives reasoned strategies to improve adherence of patients taking prescriptions <i>Strategies show awareness of the main reasons for non-compliance. Some parts may be in detail</i> 3-4	Gives reasoned and relevant strategies to improve adherence of patients taking prescriptions with detailed reasoning <i>Strategies show awareness of the main reasons for non-compliance.</i> 5-6
	AC1.3 compare options for administering medicines	Makes a comparison with some valid points of the advantages and disadvantages of different options of administration 1-2	Makes a comparison with mostly valid points of the advantages and disadvantages of different options of administration <i>Some parts of the comparison are in detail, with examples given</i> 3-4	Makes a detailed and valid comparison with good reasoning of the advantages and disadvantages of different options of administration <i>Range of examples are provided to support the comparison</i> 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO2 understand how medicines work	AC2.1 explain the molecular basis of the action of medicines	Gives an explanation of the molecular basis of the action of medicines <i>Low level explanations may not always clearly show reasoning</i> 1-2	Gives a mainly accurate and coherent explanation of the molecular basis of the action of medicines Some relevant examples are given 3-4	Gives an accurate and coherent explanation showing detailed reasoning of the molecular basis of the action of medicines. Relevant examples are given to support explanation 5-6
	A.AC2.2 explain how medicines affect body systems	Gives an explanation of how medicines affect body systems. <i>Low level explanation covers a limited number of body systems, with limited examples to support explanations</i> 1	Gives a mainly accurate and coherent explanation of how medicines affect body systems. <i>Explanation covers a number of body systems, with some examples to support explanations</i> 2-3	Gives an accurate and coherent explanation of how medicines affect body systems. <i>Explanation covers a range of body systems, with a number of relevant examples to support explanations</i> 4
	AC2.3 explain how medicines affect causative agents of infectious diseases	Gives an explanation of how medicines affect causative agents of infectious diseases <i>Low level explanations may not always clearly show reasoning</i> 1-2	Gives a mainly accurate and coherent explanation of how medicines affect causative agents of infectious diseases 3-4	Gives an accurate and coherent explanation showing detailed reasoning of the how medicines affect causative agents of infectious diseases 5-6
	AC2.4 explain why medicines may lose their effectiveness	Gives an explanation of why medicines may lose their effectiveness <i>Low level explanations may not always clearly show reasoning</i> 1	Gives a mainly accurate and coherent explanation of why medicines may lose their effectiveness 2	Gives an accurate and coherent explanation with detailed reasoning of why medicines may lose their effectiveness 3
	AC2.5 compare the effects of the interaction of medicines	Makes some suitable comparisons of the effects of the interaction of medicines <i>Low level comparisons may not always show clear reasoning</i> 1	Makes mainly suitable comparisons of the effects of the interaction of medicines 2-3	Makes suitable comparisons of the effects of the interaction of medicines <i>Comparisons are detailed with clear reasoning</i> 4
	AC2.6 explain how factors affect the distribution of medicines in the body	Gives an explanation of how factors affect the distribution of medicines in the body 1-2	Gives a mainly accurate and coherent explanation of how factors affect the distribution of medicines in the body 3-4	Gives an accurate and coherent explanation showing detailed reasoning of how factors affect the distribution of medicines in the body 5-6

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO2 cont.	AC2.7 explain how adverse reactions to medicines can occur	Gives an explanation how adverse reactions to medicines can occur 1-2	Gives a mainly accurate and coherent explanation of how adverse reactions to medicines can occur 3-4	Gives an accurate and coherent explanation with detailed reasoning of how adverse reactions to medicines can occur 5-6
	AC2.8 explain fate of medicines in the body	Gives an explanation of the fate of medicines in the body <i>Low level explanations may not always clearly show reasoning</i> 1-2	Gives a mainly accurate and coherent explanation of the fate of medicines in the body Some relevant examples are given 3-4	Gives an accurate and coherent explanation showing detailed reasoning of the fate of medicines in the body. Relevant examples are given to support explanation 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO3 understand principles of treatment of cancer	AC3.1 describe what is meant by the term cancer	Gives a mostly clear description of the term cancer 1	Gives a clear description of the term cancer 2-3	Gives a clear and detailed description of the term cancer 4
	AC3.2 explain the genetic basis of cancer	Gives an explanation of the genetic basis of cancer <i>Low level explanations may not always clearly show reasoning</i> 1-2	Gives a mainly accurate and coherent explanation of the genetic basis of cancer 3-4	Gives a mainly accurate and coherent explanation of the genetic basis of cancer 5-6
	AC3.3 describe possible treatment options for cancer	Gives a description of some possible treatment options for cancer 1-2	Gives a mainly clear description of possible treatment options for cancer 3-4	Gives a clear and detailed description of a range of possible treatment options for cancer 5-6
	AC3.4 assess the potential impact of new treatments for cancer	Gives an assessment of the potential impact of new cancer treatments with reference to a limited range of treatments and some reasoned judgements 1-2	Gives an assessment of the potential impact of new cancer treatments with reference to some treatments and with mainly reasoned judgements 3-4	Gives a detailed assessment of the potential impact of new cancer treatments with reference to a range of treatments and with reasoned judgements 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome <i>The learner will:</i>	Assessment criteria <i>The learner can:</i>	Performance bands		
		Band 1	Band 2	Band 3
LO4 be able to provide information about medicines	AC4.1 communicate information to an audience	Communicates some information to an audience Present some information in appropriate ways 1-3	Communicates some information to an audience effectively Most information is communicated clearly and appropriately 4-6	Effectively and clearly communicates information in an appropriate manner using language accessible to the audience 7-9
	AC4.2 justify approach to communicate information	Justifies the approach used <i>Low level explanations may not always clearly show reasoning</i> 1-2	Justifies the approach used with some clear and detailed reasoning 3-4	Justifies the approach used with clear and detailed reasoning 5-6
	AC4.3 work as part of a team	Demonstrates some ability to work as a team member 1	Demonstrates some ability to work as an effective team member 2-3	Consistently demonstrates the ability to work as an effective team member 4

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Assessment

This unit is internally assessed and externally moderated through a summative controlled assessment. All assessment must be conducted under controlled assessment conditions.

Section 3.3 of the specification details the principles involved in internal assessment. WJEC has produced a model assignment for this unit which is available through the WJEC secure website.

Guidance for Delivery

Making teaching vocationally relevant

It is important that learners recognise the knowledge and understanding they develop are vocationally relevant. There are a number of ways in which this can be achieved:

- arranging visits to work places who prescribe, dispense and administer medicines and treatments, this could include; hospital departments, pharmacists, GP surgeries and Health centres;
- arranging talks by visiting speakers from a range of Health Care professions: doctors, consultants, health visitors and nurses;
- arranging talks by visiting speakers from pharmaceutical companies to talk about drug research and the action of specific drugs;
- developing learning activities in conjunction with relevant individuals/organisations, for example reviewing current advice/information provided to patients from a specific hospital department.

The following are examples of approaches to delivery which could be used to enhance the learners' understanding of the vocational importance of medicines and the treatment of disease.

Example 1

Reviewing and improving advice on medicines

Learners will need to be provided with formative opportunities to develop the understanding and skills required by the summative assessment for this unit in the controlled assessment. Learners could review information that is currently provided as "medicines advice" by a pharmaceutical company or national organisation for a specific group of drugs. They could work in teams to review this information and then develop their own advice. For example, learners (working in teams) could review the information provided by the NHS on Beta-blockers (<http://www.nhs.uk/Conditions/Beta-blockers/Pages/Introduction.aspx>), they could then develop their own web pages.

Example 2

Providing information for specific groups

Learners need to consider how information and advice should be adapted to suit particular audiences. Information for colleagues in Health Care might be very different to information provided for patients. Alternatively information given on treatment might be very different in terms of format and style if the patient is a teenager compared to if the patient is elderly.

Depression is a condition which affects many teenagers, but also the elderly. Learners could be asked to produce information in suitable format and style for both of these groups on how medicines used to treat this condition work, any particular interactions and adverse reactions that these groups of patients need to be aware of.

Example 3

Presentation on cancer for a charity to use

The treatment of cancer is a rapidly evolving aspect of medicine. Learners could be asked to develop a presentation that "Cancer Research UK" could use to document the progress in cancer diagnosis, treatment and survival from the 1970's to the present day. The presentation should include information on the potential impact of new treatments for cancer. Cancer research UK would like to use this presentation for fund raising purposes and will be selecting the "best" presentation from the class to use.

Making Contacts

Examples of organisations that may be approached to provide help include:

- Hospitals and Health Care Trusts;
- other health care settings and individuals (e.g. doctors, practice nurse, health centres);
- pharmacists;
- private health care facilities;
- university medical and human biology departments;
- pharmaceutical organisations.

Unit 5 Clinical Laboratory techniques

WJEC unit entry code

Guided learning hours 45

Aim and purpose

This unit develops knowledge and understanding about the clinical laboratory techniques that can be used to assess body functions. It relates knowledge and understanding of human physiology and biochemistry to clinical measurement test results through an understanding of the principles of the measurement techniques.

The unit will enable learners to perform tests which will accurately measure a range of biochemical and microbiological parameters. They will be able to interpret the results of their tests, and other test results and link these results to possible physiological disorders.

Unit introduction

What measurements do biomedical scientists carry out on patient samples? How do they carry out these tests? How do they ensure that they work safely and avoid contamination? How do they interpret their data? How do they report their data in a suitable format for health professionals to draw conclusions?

Laboratory measurement plays a very important role in the diagnosis and treatment of patients in a range of clinical settings. These measurements may involve simple biochemical tests, microscopy or microbiology, or they may be more complicated, using the polymerase chain reaction (PCR) or Enzyme-linked immunosorbent assay (ELISA). Following these laboratory measurements, healthcare professionals will use the results to monitor for signs of abnormality (i.e. anything that falls outside of the 'normal' range). Health professionals will then be able to draw conclusions about the health status of the individual and any treatments they may require.

This unit is designed to help you understand how biomedical scientists investigate the function of body systems by undertaking laboratory-based measurements. You will learn how they use specialist equipment, advanced technologies and a range of different procedures. Most clinical scientists work in hospital laboratories or specialist departments, often working as a team to allow healthcare professionals to assess patient status.

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO1 understand clinical testing	AC1.1 explain principles of clinical tests	Clinical tests <ul style="list-style-type: none"> • biochemical tests e.g. simple identification tests (for glucose, protein, sodium ions, potassium ions, calcium ions), simple colorimetric assays, enzyme assays (kinetic and end point), chromatography (TLC, GLC, HPLC), radioactive immunoassays (RIA), ELISA, spectrophotometry, nephelometry, turbidimetry • haematology tests e.g. red blood cell count, white blood cell count, haemoglobin, haematocrit, differential count, platelet number estimation • histopathology techniques e.g. sample preparation, microscopy, immunohistochemistry • microbiological techniques e.g. aseptic technique, serial dilution, staining, growth of bacterial populations • genetic techniques e.g. use of restriction enzymes, gel electrophoresis, PCR, DNA sequencing
	AC1.2 explain factors that affect clinical test results	Factors <ul style="list-style-type: none"> • sensitivity • specificity • interfering agents • human error

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO2 be able to carry out clinical laboratory techniques	AC2.1 plan tests	Plan <ul style="list-style-type: none"> • identify information required • procedures and equipment • sequencing of activities • timing
	AC2.2 assess biological samples using clinical tests	Biological samples <ul style="list-style-type: none"> • blood • plasma • urine Equipment <ul style="list-style-type: none"> • correct use Safe working practice <ul style="list-style-type: none"> • works in accordance with risk assessment and laboratory requirements • correctly uses PPE • maintains tidy working area
	AC2.3 record results from tests	Recording documentation <ul style="list-style-type: none"> • laboratory notebook • use of proformas Records <ul style="list-style-type: none"> • key information recorded • correct format • data recorded to correct precision • entries legible

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>	<i>The learner can:</i>	
LO3 be able to process data from clinical tests	AC3.1 use graphs to process data	Graphs <ul style="list-style-type: none"> • calibration curve • best-fit lines Graphical methods <ul style="list-style-type: none"> • by hand • using software (e.g. Excel/graphical packages)
	AC3.2 use numerical methods to process data	Numerical methods <ul style="list-style-type: none"> • manipulation of algebraic expressions Significant figures <ul style="list-style-type: none"> • records data to appropriate number significant figure
	AC3.3 interpret data from clinical tests	Interpretation <ul style="list-style-type: none"> • identification of outliers • compares data with expected range • significance of data Expected ranges <ul style="list-style-type: none"> • red blood cell count, white blood cell count, platelet count • blood glucose • plasma proteins • sodium ions, potassium ions, calcium ions
	AC 3.4 communicate information to an audience	Communication style <ul style="list-style-type: none"> • audience <ul style="list-style-type: none"> ○ scientifically literate audience ○ audience with basic scientific understanding • information <ul style="list-style-type: none"> ○ structure, clarity, style • language including technical and scientific • appropriate use of English • relevance information to audience

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO1 understand clinical testing	AC1.1 explain principles of clinical tests	<p>Gives an explanation of the principles of clinical tests using some relevant scientific concepts</p> <p><i>Low level explanations may not always clearly show reasoning</i></p> <p>Test 1 1-2</p> <p>Test 2 1-2</p> <p>Test 3 1-2</p>	<p>Gives a mainly accurate and coherent explanation showing some detailed reasoning of the principles of clinical tests</p> <p>Test 1 3-4</p> <p>Test 2 3-4</p> <p>Test 3 3-4</p>	<p>Gives an accurate, detailed and coherent explanation showing detailed reasoning of the principles of clinical tests</p> <p>Test 1 5-6</p> <p>Test 2 5-6</p> <p>Test 3 5-6</p> <p><i>Max mark available 18</i></p>
	AC1.2 explain factors that affect clinical tests	<p>Gives an explanation of the factors that affect clinical tests using some relevant scientific concepts.</p> <p><i>Low level explanations may not always clearly show reasoning</i></p> <p>1-2</p>	<p>Gives a mainly accurate and coherent explanation showing some detailed reasoning of the factors that affect clinical tests.</p> <p>3-5</p>	<p>Gives an accurate, detailed and coherent explanation showing detailed reasoning of the factors that affect clinical tests.</p> <p>6-7</p>

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO2 be able to carry out clinical laboratory techniques	AC2.1 plan tests	Identifies some information to collect Identifies some appropriate procedures and equipment to collect information Sets some achievable times to complete some aspects of the plan 1-3	Identifies most information to collect Identifies mainly appropriate procedures and equipment to collect information Sets achievable times to compare most aspects of the plan 4-6	Identifies the information to collect Identifies appropriate procedures and equipment to collect information Sets achievable times to complete all aspects of the plan 7-9
	AC2.2 assess biological samples using clinical tests	Maintains tidy working area Works in accordance with risk assessment and laboratory requirements Uses PPE when required Uses equipment to obtain some suitable data within expected tolerance of instruments / procedures Test 1 1-2 Test 2 1-2 Test 3 1-2	Maintains tidy working area at all times Works in accordance with risk assessment and laboratory requirements without reminding or prompting Correctly uses PPE without reminding or prompting Uses equipment to obtain mostly suitable data within expected tolerance of instruments / procedures Test 1 3-4 Test 2 3-4 Test 3 3-4	Maintains tidy working area at all times Consistently works in accordance with risk assessment and laboratory requirements without reminding or prompting Correctly uses PPE without reminding or prompting Consistently uses equipment to obtain suitable data within expected tolerance of instruments / procedures Test 1 5-6 Test 2 5-6 Test 3 5-6

Max mark available 18

Learning Outcome The learner will:	Assessment criteria The learner can:	Performance bands		
		Band 1	Band 2	Band 3
LO2 cont.	AC2.3 record results from tests	Most key data is recorded Entries are generally legible Some data recorded to appropriate precision 1	All key data is recorded Most entries are legible Most data recorded to appropriate precision 2-3	All key data is recorded All entries are legible All data recorded to appropriate precision 4

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

		Band 1	Band 2	Band 3
LO3 be able to process data from clinical tests	AC3.1 use graphs to process data	Some suitable graph styles are used Mostly suitable sizes and scales are used to construct graphs Graphs have some correct labelling 1-2	Suitable graph styles are used Suitable sizes and scales are used to construct graphs Graphs are mostly fully and correctly labelled 3-4	Suitable graph styles are used Suitable sizes and scales are consistently used to construct graphs Graphs are consistently fully and correctly labelled 5-6
	AC3.2 use numerical methods to process data	Uses some suitable methods to process data Some aspects of calculations are clearly presented Makes use of significant figures 1-2	Uses suitable methods to mostly accurately process data Calculations are mostly clearly and logically presented Makes some appropriate and accurate use of significant figures 3-4	Consistently uses suitable methods to accurately process data Calculations are clearly and logically presented Consistently makes appropriate and accurate use of significant figures 5-6
	AC3.3 interpret data from clinical tests	Makes some appropriate interpretation of information 1-2	Makes mostly accurate and appropriate interpretation of information <i>Some parts are in detail</i> 3-4	Makes an accurate, appropriate and detailed interpretation of information 5-6
	AC3.4 communicate information to an audience	Communicate some information Uses some appropriate scientific and technical language Uses some appropriate styles and structure Uses some accurate spelling, punctuation and grammar 1-2	Mostly clearly communicates information Mostly uses appropriate scientific and technical language Uses mostly appropriate styles and structure Uses mostly accurate spelling, punctuation and grammar 3-4	Clearly communicates information Consistently uses appropriate scientific and technical language Uses appropriate styles and structure Uses accurate spelling, punctuation and grammar 5-6

Zero marks to be awarded where there is insufficient evidence to achieve a mark at band 1

Assessment

This unit is externally assessed by an assignment provided by WJEC annually in September of each academic year. This assignment will be downloadable from the WJEC secure website. Further information about the assessment of this unit can be found in **section 3.2** of the specification.

Guidance for Delivery

Making teaching vocationally relevant

It is important that learners recognise the knowledge and understanding they develop are vocationally relevant. There are a number of ways in which this can be achieved:

- arranging visits to clinical laboratories;
- arranging talks by visiting speakers who are involved in clinical testing (doctors, nurses, laboratory-based scientists etc.)

The following are examples of approaches to delivery which could be used to enhance the learners' understanding of the vocational importance of clinical laboratory techniques.

Example 1

A Medical Laboratory Scientific Officer could describe the processes that samples go through for biochemical testing. They could discuss the different assay methods used and throughput in the labs on a conventional day. Standard tests and less common testing methods could be discussed. Automation within clinical labs could be demonstrated. Learners could then write a short report on their findings.

Example 2

A medical practitioner such as a nurse could visit the centre to discuss how blood, urine, and other biological samples are taken. They could describe the processes which these samples go through to be 'booked in' for clinical testing. The learners could create a 'timeline' for analysis and results to be relayed to patients.

Example 3

Learners could visit a histopathology laboratory to observe the processes whereby tissue samples are preserved and embedded, sectioned and viewed under the microscope. They could be showed different staining techniques and the use of immunohistochemistry could be demonstrated.

Making Contacts

Examples of organisations that may be approached to provide help include:

- Local Health Authorities;
- Local clinical testing laboratories and services;
- Local universities offering biomedical science degrees;
- The Association for Clinical Biochemistry and Laboratory Medicine
– www.acb.org.uk.

Unit 6 Medical case study

WJEC unit entry code

Guided learning hours 35

Aim and purpose

This unit is the overall synoptic unit for the Diploma qualification. It provides the opportunity for candidates to demonstrate their understanding of the connections between the other five units of this Medical Science qualification. The content of this unit requires candidates to apply skills, techniques, knowledge, understanding and concepts from across the qualification content in order to complete the required assessment.

The assessment provides integrated and purposeful contexts in which candidates will demonstrate the knowledge, understanding and skills they have developed through all the other units within the qualification. The contexts provided are medical case studies, which require candidates to analyse the information provided and develop a thorough assessment of the situation based on their knowledge and understanding gained from the other units of this qualification.

Unit introduction

How is a case study approach used within medical and healthcare education and training? How do they provide information about a particular patient or particular scenario, which can be reviewed and assessed, so that recommendations can be made? What methods are used to collect patient data? How does patient data and case studies allow health professionals to draw conclusions?

Medical case studies are useful when there is a need to obtain an in-depth appreciation of a condition or patient of interest, in a real-life context. Typically data is gathered from a variety of sources and by using several different methods. Research may also continue for an extended period of time so processes and developments can be studied as they happen.

The case study method often involves simply observing what happens to, or reconstructing 'the case history' of a single participant or group of individuals (such as a school class or a specific social group). The case study is not itself a research method, but researchers select methods of data collection and analysis that will generate material suitable for case studies.

In this unit you will develop your problem-solving skills through the analysis of case studies. You will make use of your knowledge and understanding of human physiology, physiological measurement, clinical testing, statistical research, and medical treatment including the use of medicines.

Learning outcomes	Assessment criteria	Content
<i>The learner will:</i>		
LO1 understand physiological information presented within case studies	Assessment criteria from unit 1	Content from unit 1
LO2 understand how physiological measurement techniques can be used to support diagnosis and treatment	Assessment criteria from unit 2 <i>In addition, candidates should also be able to use the knowledge and understanding gained from unit 2 to recommend ways in which physiological measurement techniques can be used in the particular case study situation.</i>	Content from unit 2 Physiological measurements play a very important role in the diagnosis and treatment of patients in a range of clinical settings This will require candidates to draw on their knowledge of the principles and purpose of different physiological measurement tests, as well as their understanding of how tests are performed and the relevance of results that are generated.
LO3 understand how medical research can help support diagnosis and treatment	Assessment criteria from unit 3	Content from unit 3
LO4 understand ways in which medical treatments can be used to treat diseases and disorders	Assessment criteria from unit 4 <i>In addition, candidates should be able to use the knowledge and understanding gained from unit 4 to recommend ways in which medical treatments, including medicines can be used to treat diseases and disorders.</i>	Content from unit 4 Knowing how specific interventions, in particular medicines, can be used is an essential requirement in the successful management and treatment of disorders and disease This will require candidates to draw on their knowledge and understanding of how medicines are managed and how they work. Candidates will also need to use their knowledge and understanding of other treatments for specific disorders such as cancer.
LO5 understand ways in which clinical measurement techniques can be used to support diagnosis and treatment	Assessment criteria from unit 5	Content from unit 5

Content: further guidance

As this unit is the synoptic for the whole qualification, there is relatively little new content within the unit. All the content within the unit comes from the other five units of the qualification. The unit and the associated assessment are however of a sufficient size to meaningfully cover the full range of the qualification's content. It is important that learners are given the opportunity and time to develop skills that will enable them to integrate and apply their learning in the context demanded by case studies.

Assessment

This unit is assessed through a written examination set each summer. It is a synoptic assessment of the entire qualification. Information relating to synoptic assessment can be found in **section 3.4**. Details relating to the external assessment and the management of the case studies background information accompanying the examination can be found in **section 3.2.3** and **3.2.4** of the specification respectively.

Guidance for Delivery

Making teaching vocationally relevant

It is important that learners recognise the knowledge and understanding they develop are vocationally relevant. There are a number of ways in which this can be achieved:

- Arranging talks by visiting speakers from the medical profession such as GPs, Nurses, Occupational Therapists.
- Developing learning activities in conjunction with healthcare professionals.
- Using real data from the three conditions selected in a particular exam series. For example local hospitals or clinics may provide anonymised data that could be used.
- Arranging visits to workplaces that deal with patient care. These could be hospitals, GP surgeries, occupational health clinics, physiotherapists, opticians etc.

This unit requires that learners integrate their learning from units 1 to 5. This can be done through:

- linking the underlying physiology of systems and how physiological data is measured to medical case studies;
- linking biochemical markers to measurement techniques;
- understanding how statistical data can show trends in disease and conditions;
- understanding how conditions can be treated by clinical and non-clinical methods;

Resources

Textbooks

A level Biology Textbooks

Websites

The websites outlined in other units provide a useful starting point for this unit. In addition the following sites provide case studies for study of disease

Net Doctor - useful treatment advice and case studies

<http://www.netdoctor.co.uk/>

Boots WebMD – symptom checker and useful treatment advice

<http://www.webmd.boots.com/symptoms/>

Bupa – useful health tools and treatment advice

<http://www.bupa.co.uk/health-information>

Office of National Statistics – useful for obtaining data to study nationwide prevalence of disease <http://www.ons.gov.uk/ons/index.html>

NHS Choices – useful to study how lifestyle and disease affects health

<http://www.nhs.uk/Pages/HomePage.aspx>

Public Health Wales- a useful website for information on health problems in Wales

<http://www.publichealthwales.wales.nhs.uk/>

Public Health England – As above, but for England

<https://www.gov.uk/government/organisations/public-health-england>

Resources for genetic disease

<http://www.geneticseducation.nhs.uk/genetic-conditions-54>

Cancer research UK- Lots of data and information regarding cancer

<http://www.cancerresearchuk.org>

CDC-Useful for looking up information on specific disease

<http://www.cdc.gov/diseasesconditions/>

6 ENTRY PROCEDURES

WJEC Level 3 Applied Diploma in Medical Science will be available for certification from June 2018. Thereafter, the qualification will be available for certification each June.

Centres planning to offer this qualification must be registered as an accredited WJEC centre. For details on the application and accreditation, centres should contact WJEC.

Entries for the June series must be submitted no later than 21 February.

Unit entry

Entry for individual units must be made by submitting the relevant unit codes as indicated on each unit of the specification. Entries can be made for units in the following sessions:

Unit	January 2017	June 2017	January 2018 and thereafter	June 2018 and thereafter
1		✓		✓
2	✓	✓	✓	✓
3	✓	✓	✓	✓
4			✓	✓
5				✓
6				✓
Certification (qualification award)				✓

Qualification entry

Learners will be entered for the qualification when entering for aggregation (cash-in). Aggregation does not take place automatically: it is necessary to enter the relevant code for aggregation to take place.

7 EXTERNAL MODERATION

The consistency of assessment practices and decisions across centres will be assured through the external moderation of a sample of work.

For each series where learners are entered, centres will submit a sample, according to the formula below.

<i>Total number of candidates</i>	<i>Work to be submitted (Numbers relate to alphabetical order)</i>
1 – 10	All
11 - 19	1 st and every second (1, 3, 5, 7 etc.) plus the lowest scoring* folder and additional folders as necessary (reflecting the spread of marks) to make a total sample of 10
20 - 45	1st and every fifth (1, 6, 11, 16 etc.) plus the lowest scoring* folder and additional folders as necessary (reflecting a spread of marks) to make a total sample of 10
46 - 99	1st and every eleventh (1, 12, 23, 34 etc.) plus the lowest scoring* folder and additional folders as necessary (reflecting a spread of marks) to make a total sample of 10

* *The score is based upon the marks the learners obtain for each of the units being submitted for moderation.*

Centres should ensure they keep all learner portfolios not sent to the moderator in their possession for two months after the closing date for sending samples for moderation. WJEC may require all portfolios for moderation and centres must be able to comply immediately with such a request.

Centres should submit a sample for **each unit** that includes:

- the controlled assignment brief used to set the assessment activity;
- a controlled assessment activities sheet completed and signed by the assessor to confirm that the controls for the unit, including authenticity of evidence, have been applied;
- completed mark record sheets outlining which performance bands are met by the evidence;
- all evidence produced by learners in completion of the controlled assessment, annotated appropriately by the assessor.

Moderators will review all evidence presented to ensure standards are aligned. Evidence will be judged against the following criteria:

- Task setting – were tasks set within the controls set by WJEC in the model assignment?

- Task taking – is there evidence that tasks were completed under the controlled conditions set out in the model assignment?
- Performance bands – does the evidence support assessor's judgement of a learner against national standards?
- Annotation – is the evidence produced by learners appropriately annotated?
- Authentication- is it clear that the evidence submitted was authentically produced by the learner?
- Standardisation – is there evidence of effective standardisation/internal quality assurance within the centre?

Timetable

Samples of work must be submitted for external moderation, and related mark sheets should be returned to WJEC by 15 May for the June series. Centres will need to ensure that internal submission dates are set sufficiently in advance of this to allow for authentication, assessment and standardisation.

Feedback

The outcome of moderation will be to either accept or amend a centre's assessment decisions. Guidance on actions needed before re-sitting of specified units at a subsequent moderation series will be also be provided.

Feedback will be provided through a centre moderator's report for each certification title, covering the units entered by the centre and will be accessible through WJEC secure website. The report will address the criteria referred to above.

A Principal Moderator's report will be provided for each series.

8 AWARDING AND REPORTING

Awarding and reporting of results in WJEC Level 3 Applied Diploma in Medical Science will take place in August of each year.

A **Qualification Certificate**, issued at a later date, will confirm the:

- Title
- Level
- Grade of qualification (E, D, C, B, A, A*)

Individual unit results are reported on a uniform mark scale (UMS) with the following grade equivalences:

Unit	UMS mark	UMS grade boundaries				
		A	B	C	D	E
1	240	192	168	144	120	96
2	120	96	84	72	60	48
3	120	96	84	72	60	48
4	240	192	168	144	120	96
5	120	96	84	72	60	48
6	120	96	84	72	60	48

9 ACCESS ARRANGEMENTS

Qualifications at this level often require assessment of a broad range of competencies. This is because they are vocational qualifications and prepare candidates for a wide range of occupations and higher level courses.

This specification has been designed to offer fair access for all and to minimise the need to make reasonable adjustments for learners who have particular requirements. It is expected that normally, individual learners' abilities, interests and needs will be appropriately catered for by centres through:

- (a) the choice of units and qualifications available;
- (b) the potential for personalisation of controlled assessment.

If there are any queries about the use of this flexibility inherent in the specification to meet learners' needs, or about the use of reasonable adjustments, centres should contact WJEC.

Reasonable adjustments are made for disabled candidates in order to enable them to access the assessments. For this reason, very few candidates will have a complete barrier to any part of the assessment. Information on reasonable adjustments is found in the Joint Council for Qualifications document *Regulations and Guidance Relating to Candidates who are eligible for Adjustments in Examinations*. This document is available on the JCQ website (www.jcq.org.uk).

10 POST-RESULTS SERVICES

If a centre wishes to query the outcome of the moderation and/or examination process this must be done formally by the head of the centre, notifying WJEC within 21 days of the publication of results.

The sample of work submitted for moderation will be reviewed by a moderator/examiner not involved in the original process, and the centre informed of the outcome.

Should the centre not be satisfied with the outcome of the review, there is provision for an appeal to WJEC.

11 CLASSIFICATION CODES

Every specification is assigned a national classification code (discounting code) indicating the subject area to which it belongs. The classification code for this specification is QA3.

Centres should be advised that where learners take two qualifications with the same classification code, performance indicators for the centre will show that they have only achieved one of the two qualifications. The same view may be taken if learners take two specifications that have different classification codes but have significant overlap of content. The discounting system affects the calculation of performance measures for a school in the performance tables. It does not alter the awards an individual learner has achieved or limit the qualifications they can take.

Learners who have any doubts about their subject combinations should check with the institution to which they wish to progress before embarking on their programmes.

Information on performance points can be obtained from (www.education.gov.uk) and/or DAQW (www.daqw.org.uk).

12 THE WIDER CURRICULUM

Opportunities for use of technology

Candidates need to be both effective and confident users of technology in order to move on to a more advanced study of medical science. This specification allows candidates to develop ICT skills in a wide range of different contexts.

There are numerous opportunities to use ICT throughout all units. Examples include:

- gathering data from sensors linked to data-loggers or directly to computers data logging e.g.; lung volumes or other medical data;
- analysing data – e.g. use of spreadsheets to present graphs and calculate lines of best fit;
- using presentation software e.g. to assist in giving a presentation to an audience;
- using word processing packages to present written reports;
- using blogging software to share information to a world-wide audience;
- making videos or podcasts;
- designing leaflets to communicate information.

Spiritual, Moral, Ethical, Social and Cultural Issues

The specification provides a framework and includes specific content through which individual courses may address spiritual, moral, ethical, social and cultural issues. It aims to show how science can be used to assist in understanding the underlying causes of disease. Learners should consider how conditions are treated, and balance the need for new treatments with cost to society.

Examples of issues which can be addressed through the specification are listed below.

- How lifestyle may affect health (unit 1)
- How ethical issues affect research (unit 3)
- How factors are considered when prescribing medicines (unit 4)

Citizenship

The applications and implications of science are dealt with in meaningful medical contexts, and encourage the development of a responsible attitude to citizenship. An understanding that individuals have a collective responsibility is fostered in relation to various ethical issues included in the specifications such as treatment regimens, side effects of medicines, cost of medicines to society. The consequences of lifestyle on health are also examined throughout the qualification in a number of different contexts.

Medical Issues

The qualification deals with medical science in meaningful contexts. The whole qualification therefore highlights how science is used to improve the quality of life, protecting individuals and society. Each unit will outline the medical context of the science that is to be delivered. Learners are also made aware of legislation that is in place governing activities that have a potential medical impact.

Health and Safety Consideration

Under UK law, health and safety is the responsibility of the employer. There are a number of regulations (notably Management of Health and Safety at Work Regulations 1999 and COSHH Regulations 2002 (as amended)) that require the completion of a risk assessment before commencing a procedure or activity that uses microorganisms or chemicals.

There are opportunities for learners to develop their own risk assessments when carrying out laboratory work in almost all units. Throughout the qualification there are also many opportunities to underscore the requirement to work in compliance with risk assessments in order to safe guard the health and safety of workers and members of the public.

The European Dimension

Medical issues can be rarely confined to a particular place since human actions in one country can also impact another. Challenges faced by medicine also need to be dealt with at national, European and global levels. This specification should make learners aware that medical scientists need to cooperate with scientists from other countries.

The context led nature of the units will give centres the opportunity of examining medical issues at a European level. Examples where a European dimension can be underscored include international protocols and European legislation relating to adverse drug reactions and licencing of medicinal products for human use.

Appendix 1 - Unit structure

Unit title

The title summarises in a concise manner the content of the unit.

Guided learning hours

Guided learning time represents only those hours in which a tutor is present and contributing to the learning process. In some organisations this is known as 'contact time'. This time includes lectures, supervised practical periods and supervised study time.

Aim and purpose

The aim and purpose provides a brief and clear summary of the unit. It also indicates the applied purpose for the unit.

Unit Introduction

This is written to the learner and gives a summary of the unit content. It sets the vocational context of the unit and highlights the purpose of the learning in the unit.

Learning outcomes

Learning outcomes state what the learner should know, understand or be able to do as a result of completing the learning in the unit.

Assessment Criteria

The assessment criteria specify the standard a learner is expected to meet to demonstrate that the learning outcomes of that unit have been achieved.

Unit content

The indicative content defines the breadth and depth of learning for each assessment criteria. It is expected that all the indicative content will be delivered during the programme of learning. It is not required to assess every aspect of the content when assessing the unit. Learners will be expected to apply the knowledge, understanding and skills acquired through the learning to the specifics of the assessment context.

Performance Bands

These are used to determine the overall unit mark. Performance bands do **not** add additional requirements to the assessment criteria.

Assessment

WJEC Level 3 Applied Diploma in Medical Science is assessed through both controlled assessment and external assessment. This section of the unit summarises the form of assessment used.

Guidance for delivery

This gives the tutor some ideas on how to deliver the unit in a vocational setting consistent with the philosophy of the qualifications and intent of the unit. The guidance also gives ideas of vocational settings for the unit and suggests possible contacts that could be made in the delivery of the learning.

Resources

This identifies useful resources to help in the delivery of the learning. Many of the resources listed are suitable for using with learners.

Appendix 2 - Grade Descriptors

Grade descriptors are used by WJEC to set grade boundaries for each unit. Grade descriptors give a general indication of the levels of attainment likely to be shown by a representative learner performing at each boundary. An Award meeting involving experienced examiners and teachers will be required to set the following grade boundaries for each unit. The following grade boundaries will be set at the Award meeting:

- A/B
- E/U

Grade descriptors are interpreted in relation to the content outlined in the specification; they are not designed to define that content. Once grade boundaries have been set by WJEC, learner marks are then converted to UMS marks.

Area	A/B	E/U
Knowledge and understanding of medical science	<p>Demonstrate detailed knowledge and understanding of most principles, concepts and facts from the specification.</p> <p>Consistently selects and uses relevant information from the specification.</p> <p>Consistently organises and presents information clearly, logically and in suitable structure.</p> <p>Use appropriate scientific terminology and conventions from the specification.</p>	<p>Demonstrate knowledge and understanding of some principles and facts from the specification.</p> <p>Select and use some relevant information from the specification.</p> <p>Present some information in a clear format.</p> <p>Use some appropriate terminology and conventions from the specification.</p>
Application of skills, knowledge and understanding in appropriate medical contexts	<p>Apply principles and concepts from the specification in familiar and new contexts involving several steps in the argument.</p> <p>Describe significant trends and patterns, with clear explanations, shown by complex data presented in tabular or graphical form.</p> <p>Interpret qualitative and quantitative data accurately; and present arguments and evaluations clearly.</p> <p>Evaluate critically the statements, conclusions or data.</p> <p>Carry out accurately complex calculations specified for medical science.</p> <p>Translate successfully data presented as prose, diagrams, drawings, tables or graphs, from one form to another.</p> <p>Select a wide range of facts, principles and concepts from the specification.</p> <p>Link together appropriate facts principles and concepts from different areas of the specification.</p>	<p>Apply given principles or concepts from the specification in familiar and new contexts involving a few steps in the argument.</p> <p>Describe, and provide a limited explanation of, trends or patterns shown by complex data presented in tabular or graphical form.</p> <p>Interpret some qualitative and quantitative data.</p> <p>Identify, when directed, inconsistencies in conclusions or data.</p> <p>Carry out some steps within calculations specified for medical science.</p> <p>Translate data successfully from one form to another, in some contexts.</p> <p>Select some facts, principles and concepts from the specification.</p> <p>Put together some facts, principles and concepts from different areas of the specification.</p>

Area	A/B	E/U
Use of practical skills within medical contexts	<p>Devise and plan suitable experimental and investigative activities, selecting appropriate techniques.</p> <p>Consistently demonstrates safe and skilful use of practical techniques to produce data within the expected range of tolerance for the technique.</p> <p>Make observations and measurements with appropriate precision and record these methodically.</p> <p>Interpret, explain, evaluate and communicate the results of their own and others' experimental and investigative activities, in appropriate contexts.</p>	<p>Devise and plan some aspects of experimental and investigative activities.</p> <p>Demonstrate safe use of practical techniques to produce some data within expected range of tolerance for the technique.</p> <p>Make observations and measurements and record them.</p> <p>Interpret, explain and communicate some aspects of the results of their own and others' experimental and investigative activities, in appropriate contexts.</p>
Reporting medical information	<p>Make a clear and accurate use of English (styles, spelling, punctuation and grammar) to communicate ideas and structure arguments.</p> <p>Produce logical and well-structured reports, showing a detailed scientific understanding of their work.</p> <p>Logically organise work in a coherent structure linking conclusions to supporting evidence with clarity.</p> <p>Clearly communicate with few minor errors in the use of technical terms, spelling, punctuation and grammar.</p>	<p>Make some appropriate use of English (styles, spelling, punctuation and grammar) to communicate ideas and structure arguments.</p> <p>Produce a mostly clear report, showing some understanding of their work.</p> <p>Some organisation and structure with some valid evidence.</p> <p>Communicate some suitable information without significant errors.</p>
